CLINICAL OPERATIONS DASHBOARD REPORT

PATIENT ACCESS, PROVIDER PERFORMANCE, & OPERATIONAL EFFICIENCY

Prepared by: Ari M.

March 29, 2026

This report summarizes the findings from the Clinical Operations Dashboard project, which analyzed over 3,000 clinical appointments across multiple departments. The goal of this project was to understand patient access, provider performance, referral workflows, and overall operational efficiency, and to identify areas for improvement.

EXECUTIVE SUMMARY

- Over 3,000 appointments analyzed across multiple departments (Primary Care, Specialty Care).
- No-show rate ~12%, impacting provider efficiency and clinic flow.
- Referral SLA breaches ~58%, with delays were most prominent in Cardiology and Dermatology.
- Primary care accounts for ~55% of total appointments, reflecting expected patient demand patterns.
- Revenue and patient access are impacted by delayed referrals and same-day scheduling practices.

Executive Summary

The analysis revealed several key insights about clinic operations and patient care:

- **Appointment Completion:** Roughly 83% of scheduled appointments were completed, while cancellations and no-shows continue to impact workflow efficiency.
- **No-Show Impact:** The overall no-show rate is around 12%, indicating opportunities to improve patient engagement and scheduling practices.
- **Referral SLAs:** About 58% of referrals missed their service level agreements (SLAs), especially in high-demand specialties like cardiology and dermatology.
- **Provider Workload:** Primary care accounts for more than half of all appointments, with a small subset of providers carrying a heavy workload, highlighting potential bottlenecks.
- **Patient Risk & Access:** Patients who tend to experience longer scheduling lead times, suggest a need for priority scheduling and targeted interventions.

These findings provide a foundation for actionable strategies to improve clinic efficiency and patient experience.

DASHBOARD OVERVIEW

This dashboard tracks clinic operations across appointments, referrals, provider performance, and patient risk. It provides actionable insights for improving access, efficiency, and operational decision-making.

The dashboard pages includes:

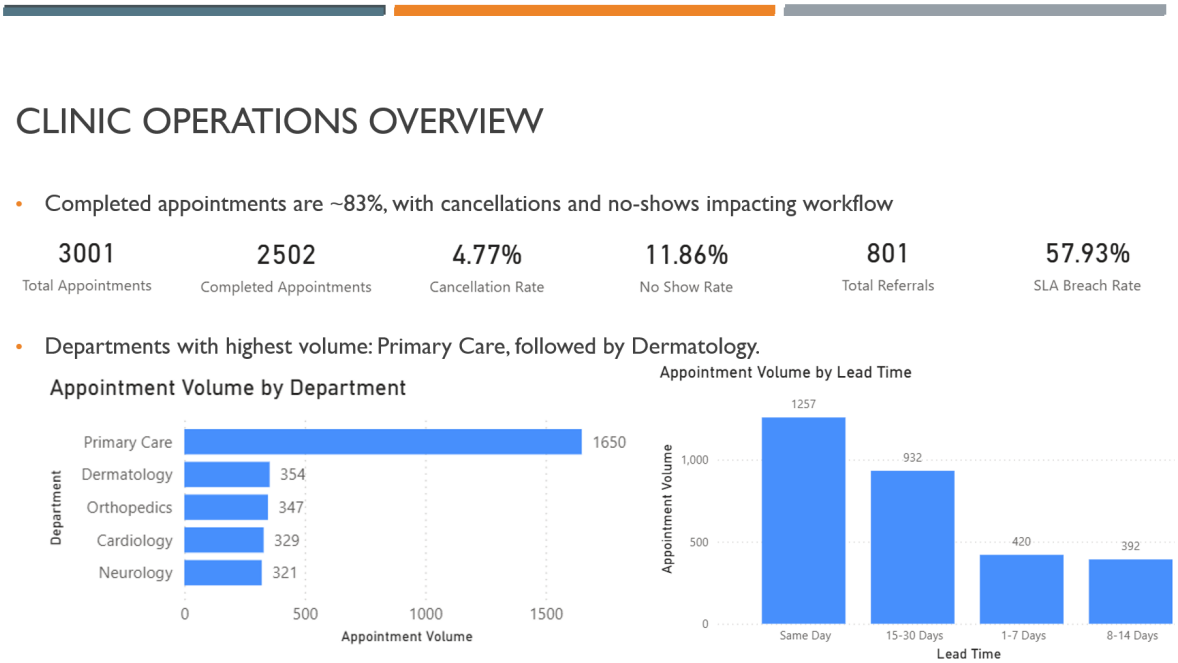
- Clinic Operations Overview
- Provider Performance
- Department Analysis
- Referral Flow & SLA
- Patient Risk Segmentation

Dashboard Overview

The dashboard integrates operational, clinical, and referral data into a single analytics platform. It tracks:

- Appointment outcomes and departmental performance
- Provider utilization and workload distribution
- Referral workflows and SLA compliance
- Patient risk segmentation and access patterns

This structure allows leadership to quickly identify bottlenecks, monitor performance, and target areas for improvement.



Clinic Operations Overview

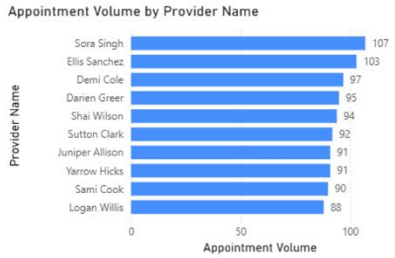
Examining overall clinic activity reveals that most appointments are completed successfully, though cancellations and no-shows still affect clinic performance.

Key Observations:

- Primary care handles the largest volume of appointments, followed by dermatology and orthopedics.
- Same-day scheduling makes up a significant portion of appointments, reflecting urgent care needs but also potential strain on scheduling systems.
- Patterns suggest opportunities to refine scheduling protocols to reduce congestion and improve patient flow.

PROVIDER PERFORMANCE

- Provider workloads: Top 5 providers handle >15% of total appointments



- No-show rates differ across providers, suggesting opportunities for patient engagement strategies

- Provider utilization: busier in primary care and specialty high-demand areas

Provider Performance

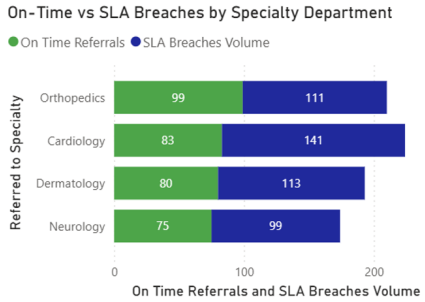
Provider-level analysis highlights both workload concentration and differences in performance across clinics.

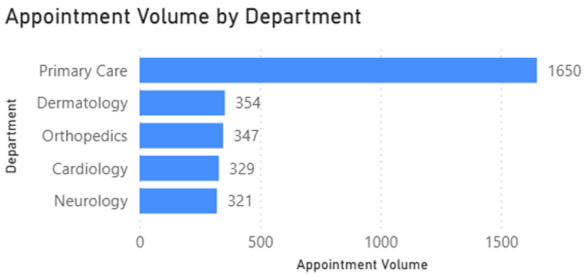
Insights:

- The top five providers account for over 15% of all appointments, indicating an uneven distribution of workload.
- No-show rates differ among providers, suggesting that targeted patient communication could improve attendance in specific clinics.
- Monitoring utilization data helps balance workloads and reduces the risk of provider burnout.

DEPARTMENT ANALYSIS

- Cardiology and Dermatology show higher SLA breaches





- Department-level KPIs reveal areas where staffing adjustments or scheduling changes could improve efficiency

Department Analysis

Looking at performance by department uncovers bottlenecks and SLA challenges.

Findings:

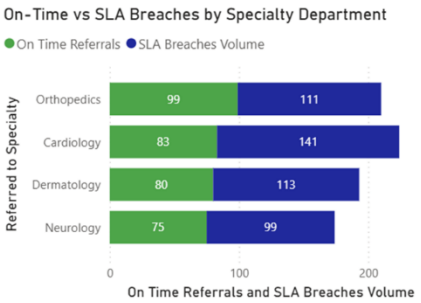
- Cardiology and dermatology have the highest rates of referral SLA breaches, which can affect both patient access and revenue.
- Primary care continues to be the main driver of appointment volume, emphasizing its central role in patient flow and referrals.
- Department-level insights can guide staffing adjustments and scheduling strategies to enhance operational efficiency.

REFERRAL & SLA ANALYSIS

- 58% of referrals breached SLA, impacting patient access and revenue

801	464	57.93%	231.40K	157.20K	67.93%
Total Referrals	Total SLA Breaches	SLA Breach Rate	Total Expected Revenue ($)	Total Lost Revenue ($)	Revenue Leakage Rate

- Most delays occur in high-demand specialties (Cardiology, Dermatology)



- Timely referral processing is critical to reduce revenue leakage and improve patient satisfaction

Referral & SLA Analysis

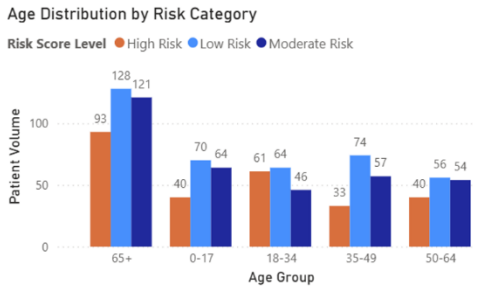
Referral workflows are critical for maintaining timely patient access and operational efficiency.

Key Points:

- Around 58% of referrals breached SLA targets.
- Most delays occur in high-demand specialties, contributing to potential revenue loss and patient dissatisfaction.
- Addressing referral delays can improve both patient experience and clinic productivity.

PATIENT RISK & ACCESS

- Patient distribution of age and risk patterns helps target interventions to improve access for vulnerable patient populations



Patient Risk & Access

Understanding patient risk categories helps prioritize care and optimize scheduling decisions.

Insights:

- Patients who often face longer lead times highlight an opportunity for priority scheduling.
- Segmenting patients by age and risk allows better resource allocation and targeted outreach.
- Implementing targeted interventions for vulnerable populations can improve outcomes and reduce no-show rates.

ACTIONABLE INSIGHTS

- Focus on reducing referral delays in high-volume specialties (Cardiology, Dermatology)
- Implement strategies to reduce no-show rates (reminders, flexible scheduling)
- Monitor provider workloads to balance patient load and improve efficiency
- Prioritize high-risk patients for timely appointments to improve outcomes
- Consider operational policies to improve same-day scheduling efficiency.

Actionable Insights

Based on these findings, the following steps are recommended:

1. **Reduce Referral Delays:** Prioritize high-demand departments like cardiology and dermatology to improve SLA adherence.
2. **Enhance Patient Engagement:** Use reminders, outreach, and flexible scheduling to reduce no-show rates.
3. **Balance Provider Workload:** Monitor appointment distribution to prevent bottlenecks and provider fatigue.
4. **Prioritize High-Risk Patients:** Adjust scheduling policies and outreach methods to ensure timely access for vulnerable populations.
5. **Optimize Same-Day Scheduling:** Review and refine operational policies to maintain efficiency while accommodating urgent care needs.
